**WORKSHOP ON MODELING STORMWATER  
MANAGEMENT PONDS USING THE PONDS<sup>®</sup>  
COMPUTER PROGRAM**

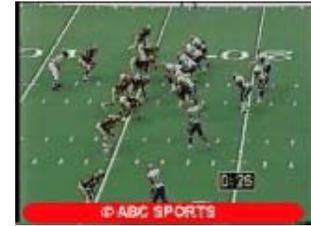

---

---

**PREPARED FOR:  
ST. JOHNS RIVER WATER MANAGEMENT DISTRICT  
AUGUST 28, 1997**

**presented by  
Devo Seereeram, Ph.D., P.E.  
Professional Geotechnical Engineer  
[www.iag.net/~devo](http://www.iag.net/~devo)**

# The Gators Tribute

## **WORKSHOP AGENDA**

---

### **SJRWMD TRAINING - PONDS COMPUTER SOFTWARE**

---

- **List of “Essential Tools” needed by permit review engineer**
  - **Engineering applications of the PONDS Software**
  - **Review conceptual models which are representative of SJRWMD**
  - **A quick tour of the *PONDS* computer program and input data requirements.**
  - **Geotechnical investigation to estimate aquifer parameters**
  - **Construction considerations for stormwater ponds**
  - **Hands-on training using PONDS 2.26 and PONDS 3.x**
- 
-

# ESSENTIAL TOOLS

## PUBLICATIONS

- USGS 7.5 minute series quadrangle map
- NRCS Soil Survey Book
- Aerial photos (if available). REDI, County, FDOT, SJRWMD
- Most recent potentiometric surface map for area
- SJRWMD Special Publication SJ93-SP10
- Florida's Geological History & Geological Resources;  
Florida Geological Survey Special Publication #35
- Seasonal high water table paper by Devo

# ESSENTIAL TOOLS (continued)

## SITE-SPECIFIC DATA

- ★ Plan of property with topographic contours and location of pond; predevelopment ground surface elevations
- ★ Characteristics of the predevelopment & postdevelopment contributing drainage area
- ★ Stage-area data of pond, including proposed pond bottom elevation relative to existing grade
- ★ Geotechnical report with borings and recommended aquifer parameters (will discuss minimum requirements for geotech reports)
- ★ Consequence of failure of pond - how sensitive?
- ★ Proximity of proposed pond(s) to adjacent ponds

# ESSENTIAL TOOLS (continued)

## SOFTWARE

- ★ **TR 55 Version 2 - used for computing time of concentration and weighted curve numbers. Available free from NRCS office in Gainesville (904-338-9555, ask for Gene Daugherty or Jesse Wilson)**
  - ★ **PONDS Version 2.26 or Version 3**
  - ★ **May need USGS MODFLOW for more complicated situations. Will explain why later. However, this should only be used by experienced modelers.**
  - ★ **May need adICPR to interface with PONDS if dealing with system of interconnected ponds.**
-

# **APPLICATIONS OF PONDS VERSION 2.26 & 3**

---

## **WATER QUALITY RECOVERY ANALYSIS**

---

- **Dry retention & wet retention ponds (unlined or partially lined)**
- **Exfiltration trenches**
- **Wet detention ponds (with & without ground water baseflow component)**
- **Dry detention ponds (with & without percolation)**
- **Underdrain ponds (with & without ground water baseflow component)**
- **Filtration systems including side-bank, pond-bottom, and VVRS filters**
- **Swales**

# **APPLICATIONS OF PONDS VERSION 2.26 & 3**

---

## **HYDROGRAPH GENERATION**

---

- **SCS Unit hydrographs (can include recovery time following storm)**
- **Water quality recovery volume hydrographs (automatic setup of time steps for SJRWMD & SWFWMD criteria)**
- **Continuous simulation hydrographs (will not discuss these today)**
- **Manually input a hydrograph in a spreadsheet type environment or cut & paste from another application such as Excel or Quattro**
- **Wastewater percolation pond hydrographs (not applicable for stormwater)**

## **APPLICATIONS OF PONDS VERSION 2.26 & 3**

---

### **ROUTING HYDROGRAPHS**

---

- True routing can be performed with or without credits for infiltration during the storm event. True routing means that the model can predict the peak stage, discharge rates, etc. like adICPR.
- PONDS is limited to: ① a single pond situation with up to 3 discharge structures, and ② cases where the tailwater condition does not rise up and submerge the overflow structure during the routing (i.e., free discharge).
- Critical duration analysis now possible with Version 3.1 where up to 100 hydrographs can be routed and critical hydrograph identified based on parameter.
- For interconnected ponds, the model can interface directly with adICPR & read adICPR hydrographs

# APPLICATIONS OF PONDS VERSION 2.26 & 3

## WATER TABLE DEWATERING & DRAWDOWN

- **Compute dewatering rates and water table drawdown impact distances for the following applications:**
  - **Borrow pits,**
  - **Ditches,**
  - **Interceptor trenches,**
  - **Wet detention ponds,**
  - **Road underdrains,**
  - **Utility line dewatering,**
  - **Etc.**
  
- **Assess setback distances from wetlands**

# **APPLICATIONS OF PONDS VERSION 2.26 & 3**

---

## **OTHER APPLICATIONS - EXTERNAL**

---

- **Retention pond fill berm slope stability analysis**
- **Channel lining analysis (HEC 15)**

# WHAT IS A CONCEPTUAL MODEL?

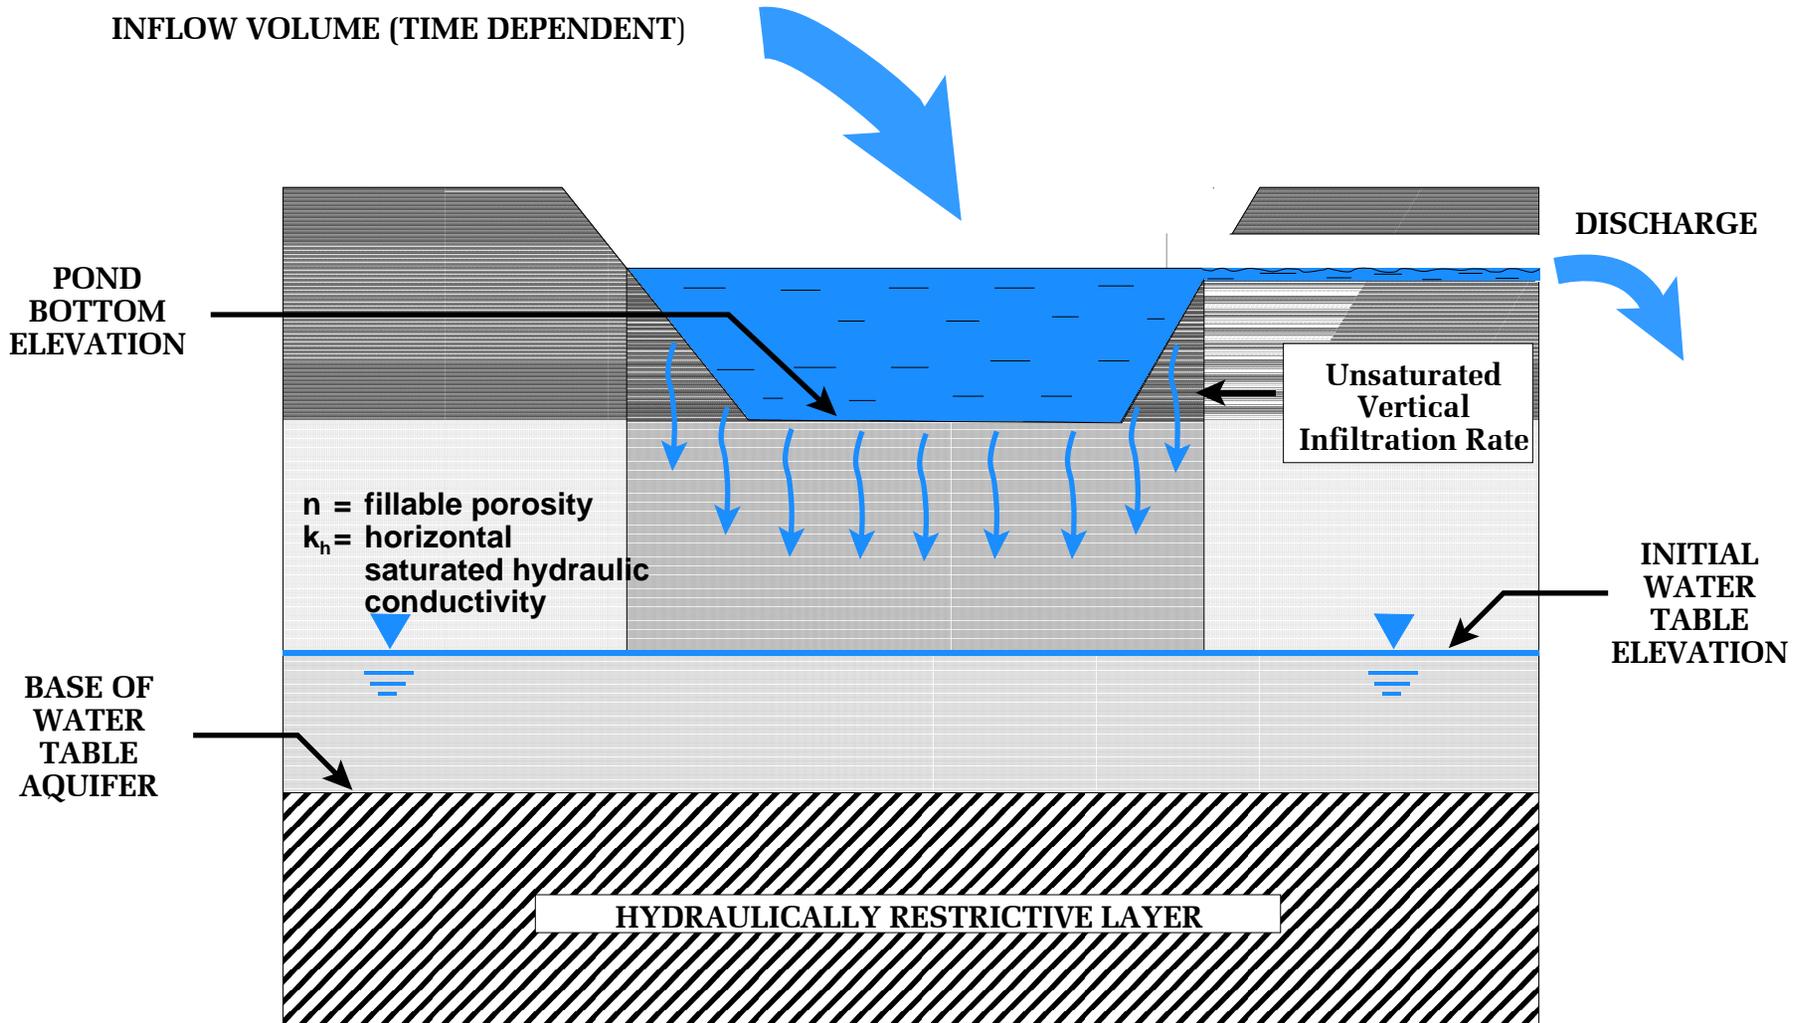

---

## PONDS WORKSHOP - SJRWMD

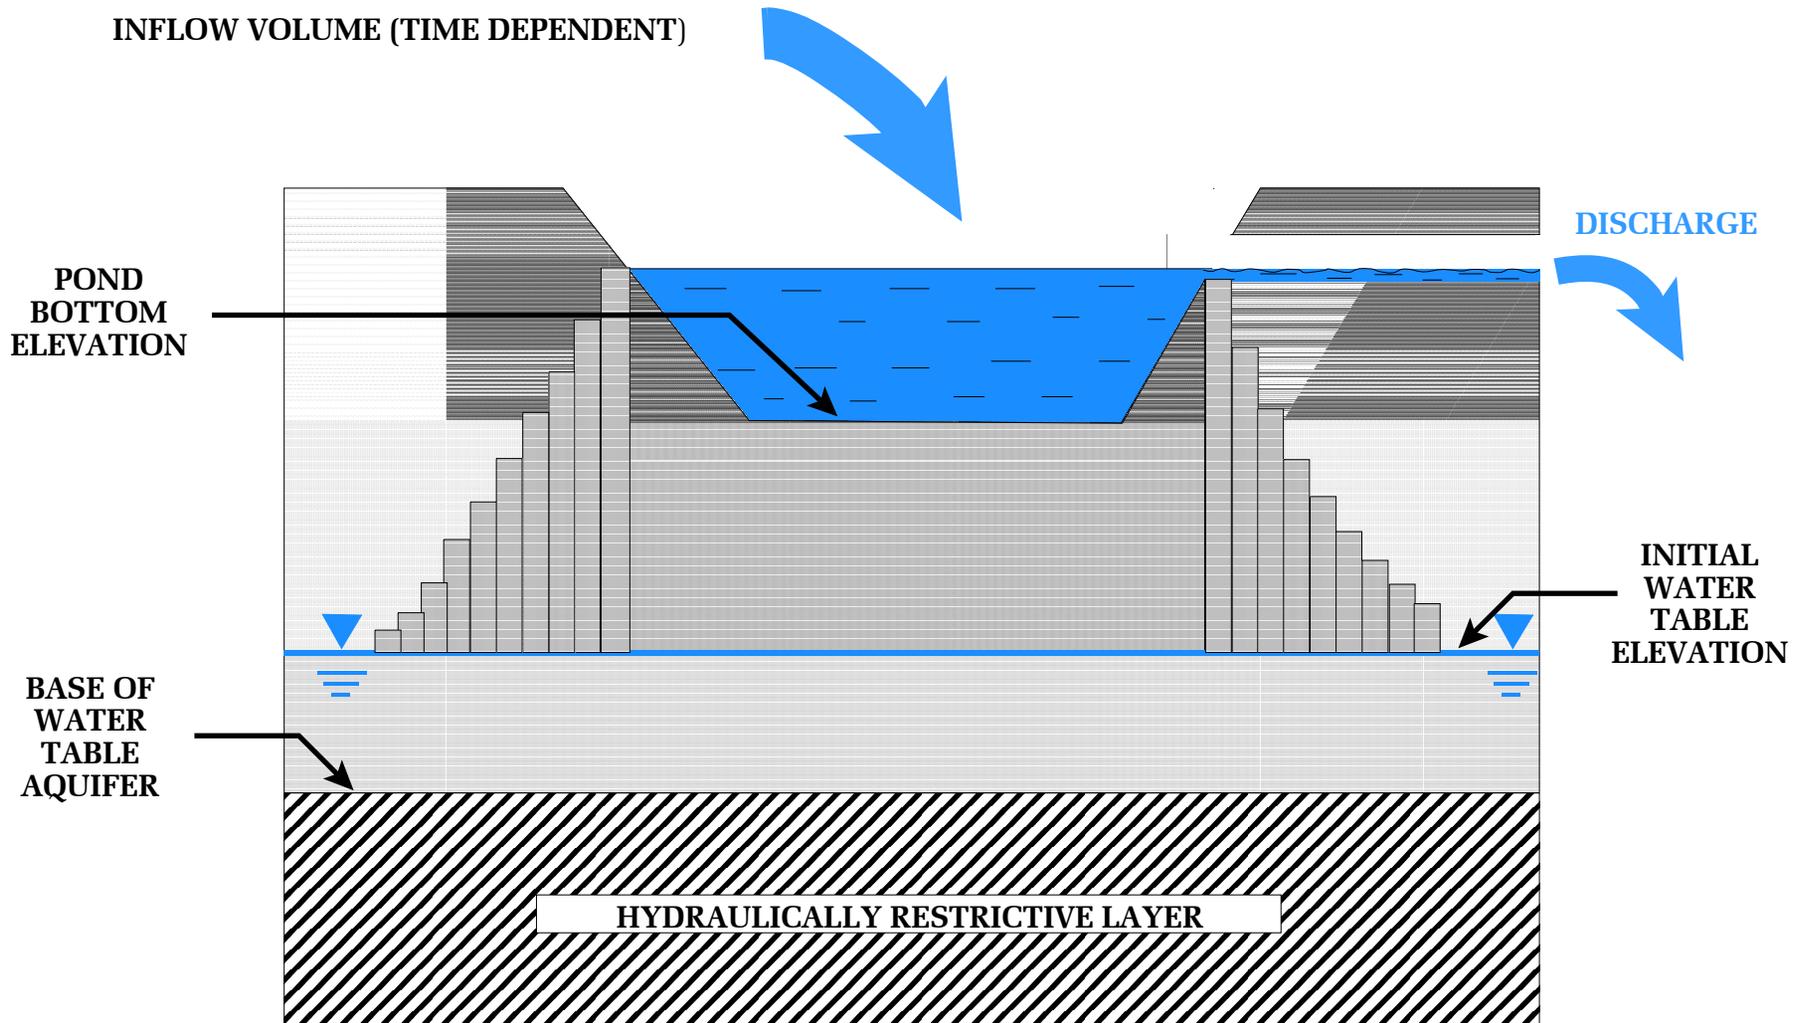

A conceptual model is a pictorial representation of the ground water flow system. In the practice of developing a conceptual model, it is desirable to strive for parsimony, by which it is implied that the conceptual model has been simplified as much as possible yet retains enough complexity so that it adequately reproduces system behavior.

The conceptual models described in this presentation can be applied to the majority of design situations in the SJRWMD.

# DRY RETENTION - STAGE I FLOW UNSATURATED VERTICAL INFILTRATION ONLY

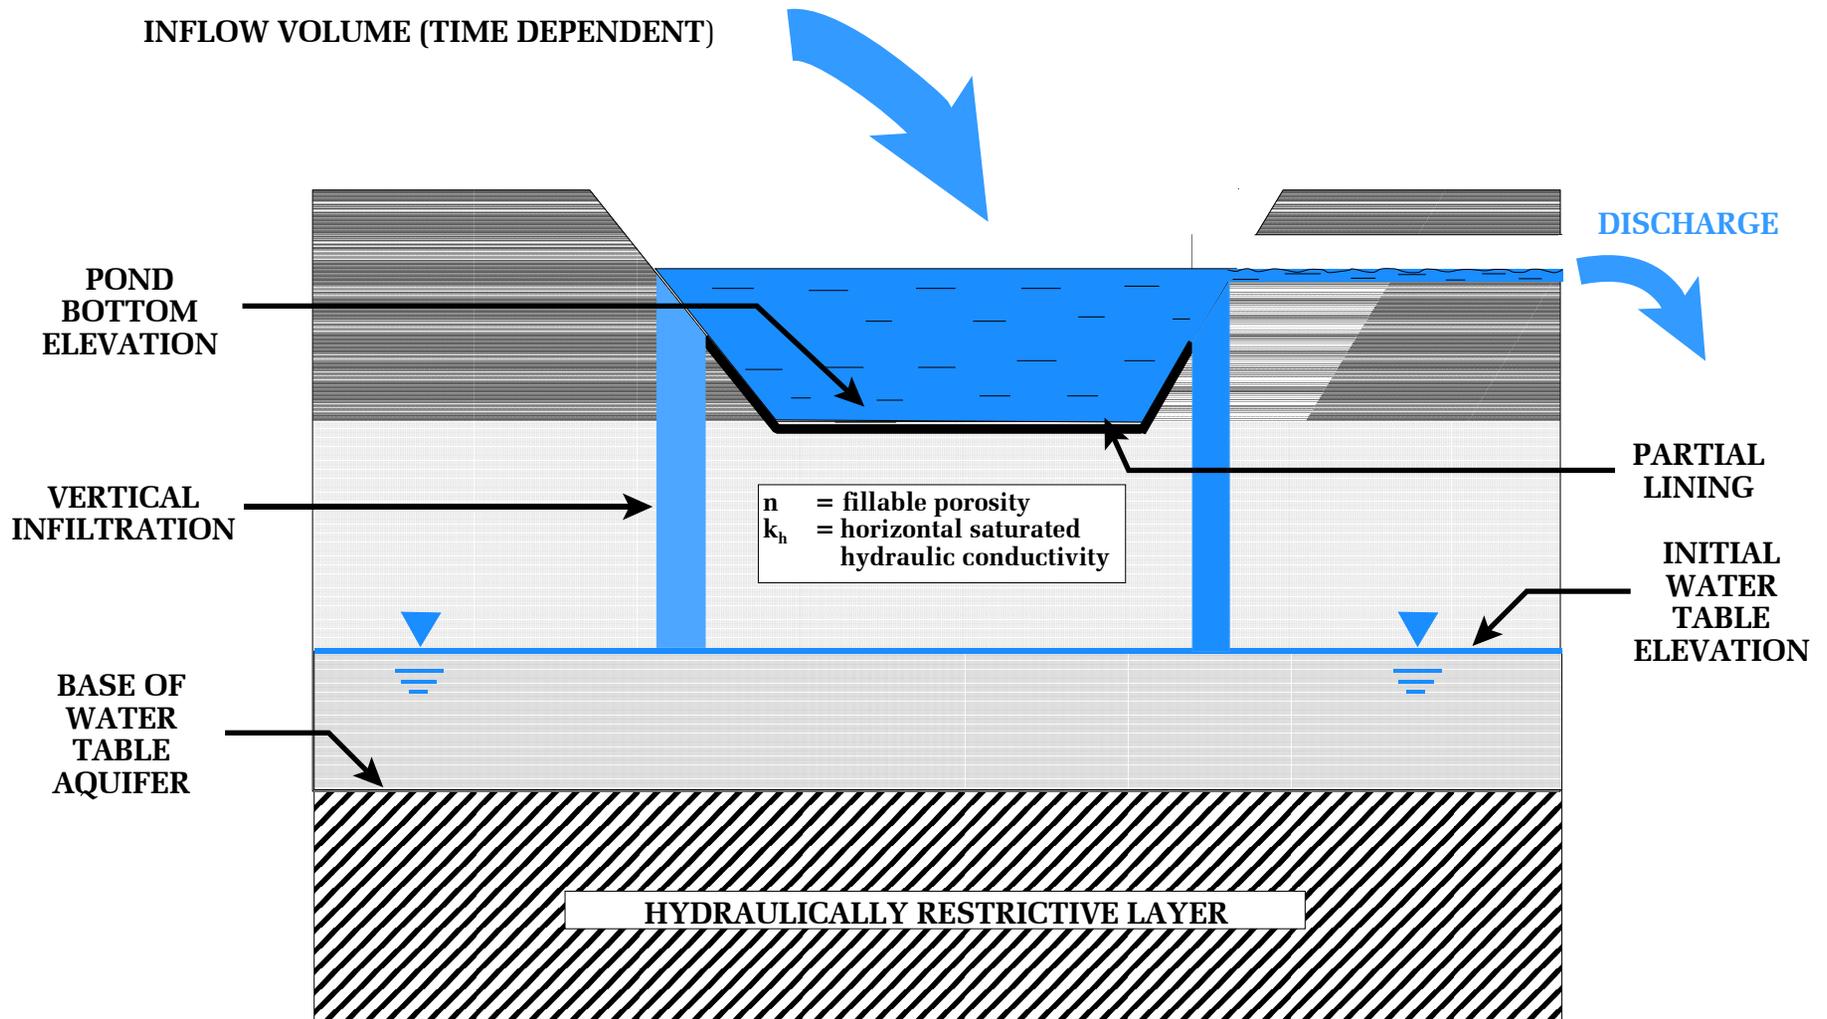

# DRY RETENTION - STAGE II RECOVERY SATURATED LATERAL FLOW

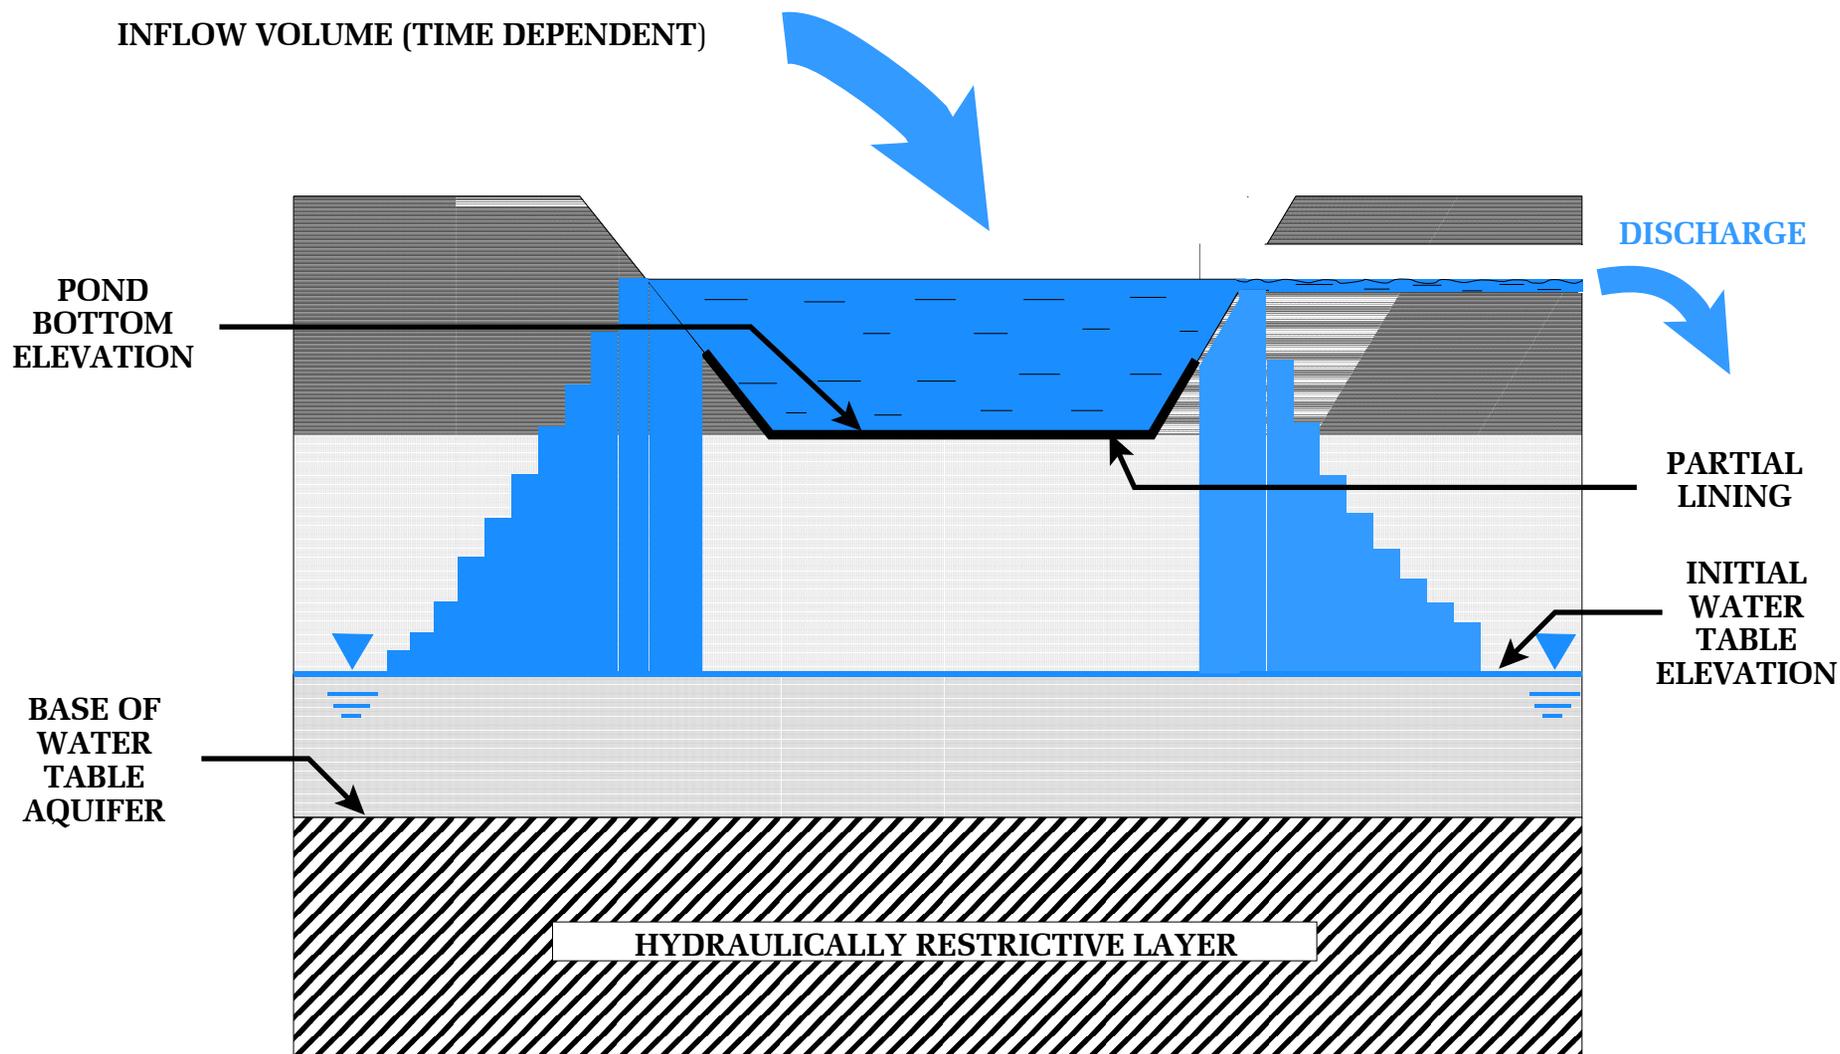

**note:** initial flat water table assumption is not unrealistic when the natural gradient is considered together with the duration of loading and the corresponding radius of influence.

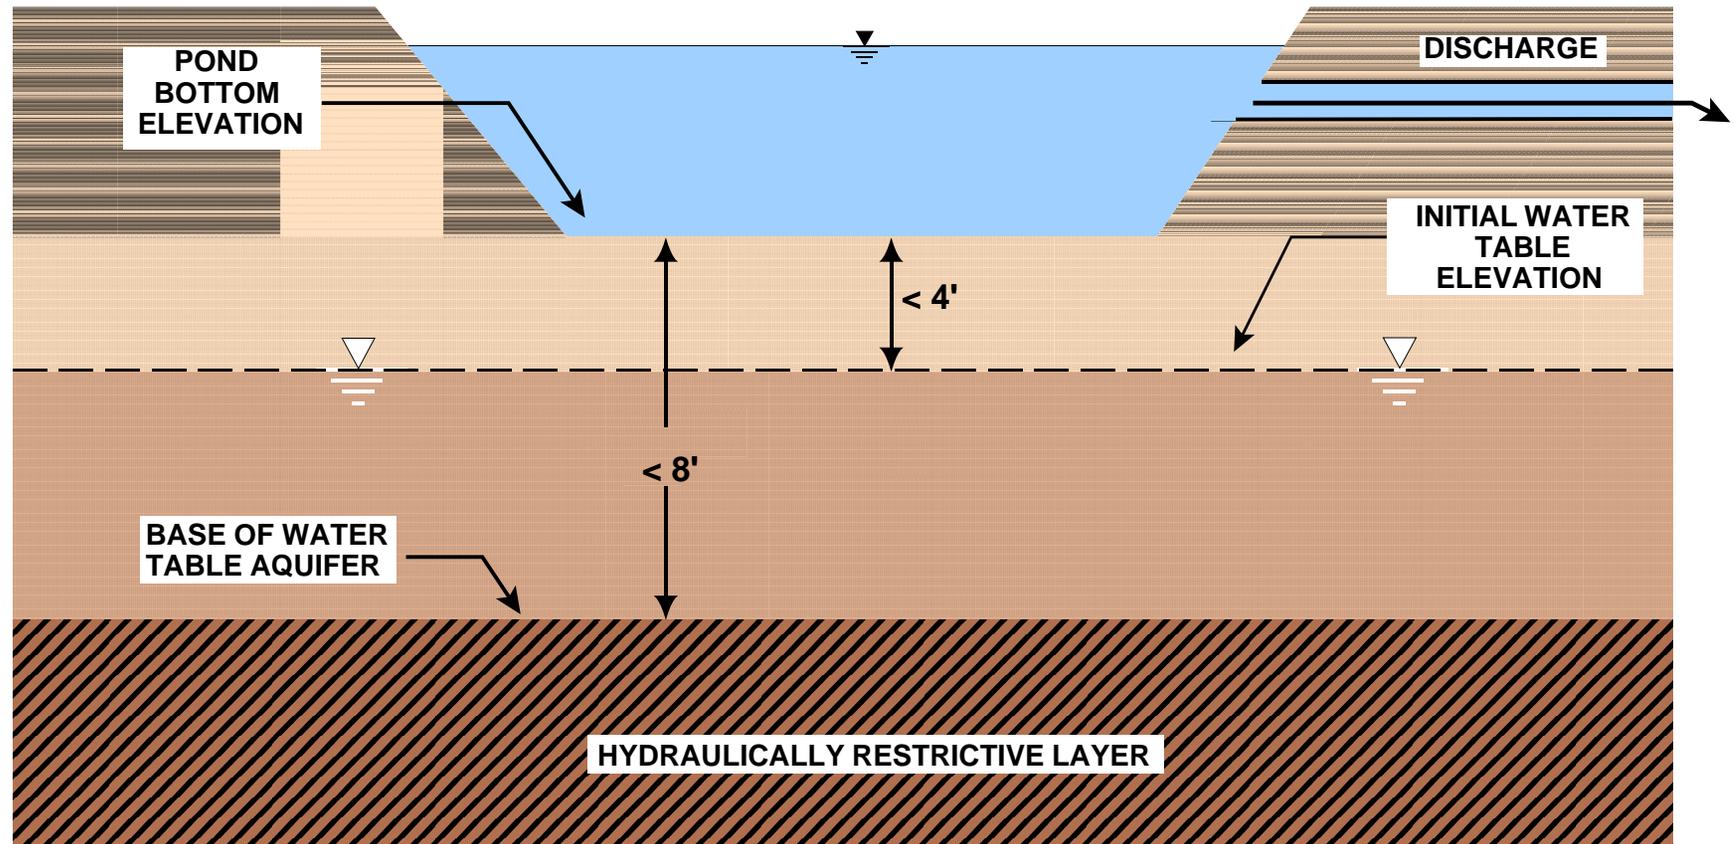

# PARTIALLY LINED RETENTION POND (STAGE I FLOW) UNSATURATED VERTICAL INFILTRATION ONLY

# PARTIALLY LINED RETENTION POND (STAGE II FLOW) SATURATED LATERAL FLOW

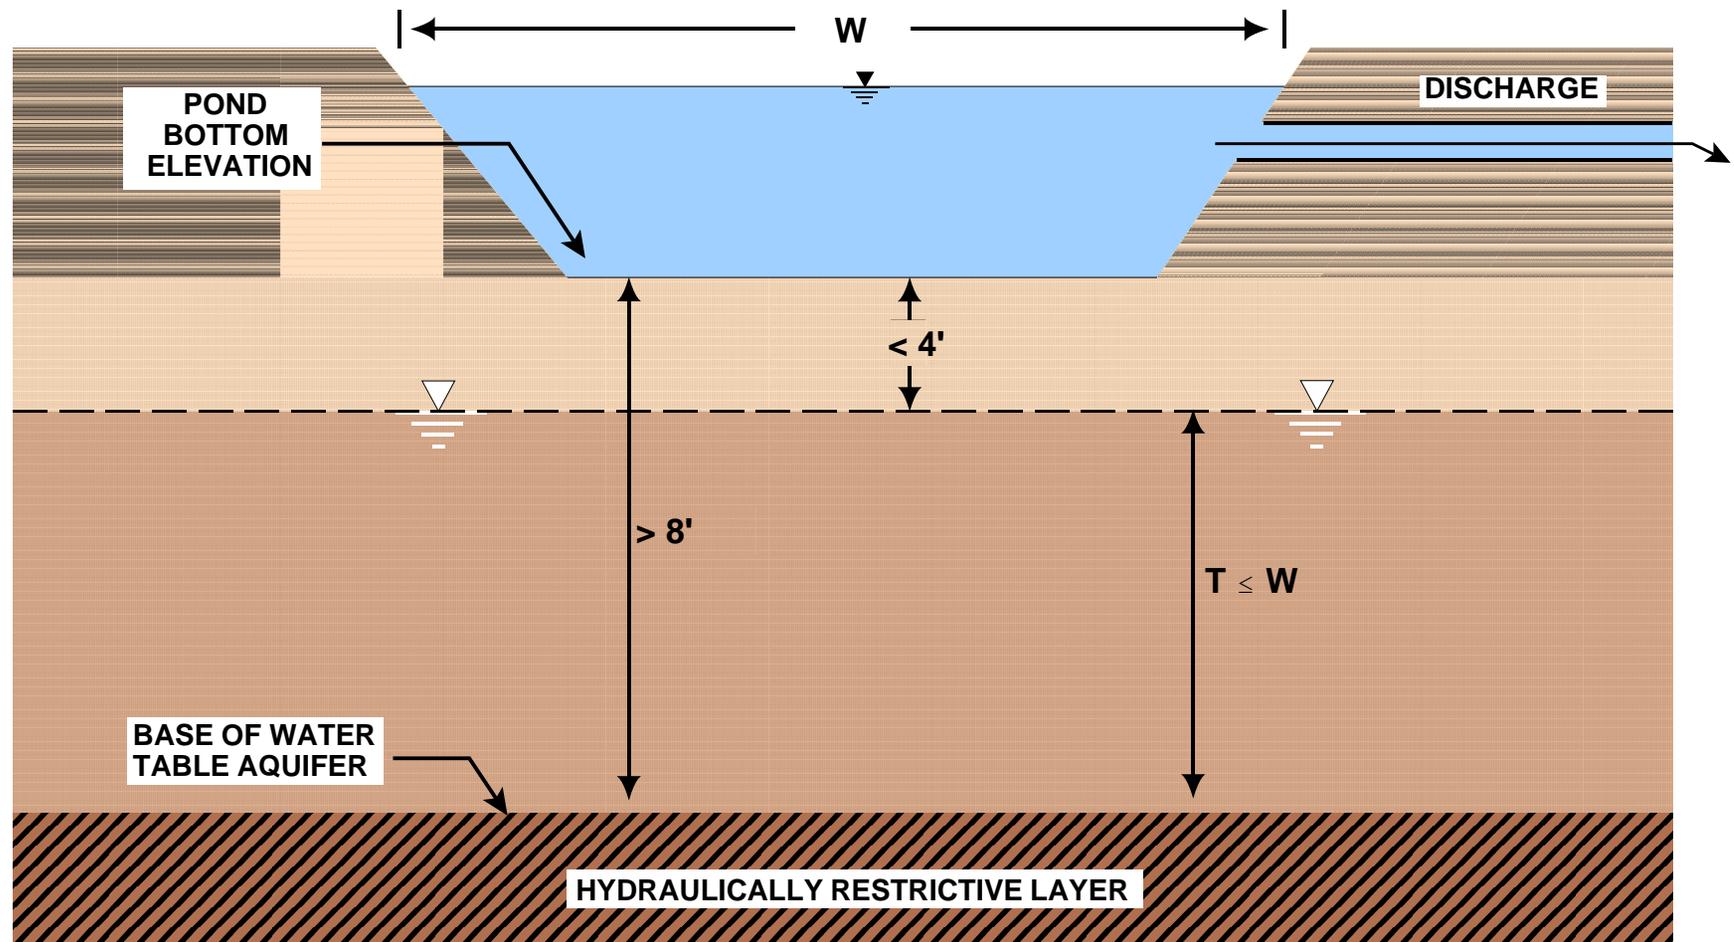

## Model #1 - Dry or Wet Retention With Thin Aquifer & Shallow Water Table

### Notes:

- ① Do not use unsaturated infiltration if SHWT within 1.5 ft of pond bottom
- ② For stormwater modeling, assume soil is confining layer is  $k < 0.1$  ft/day ( typical permeability values for soils in Florida from SJRWMD publication)
- ③ If no confining layer, base of aquifer should not extend below depth of boring
- ④ Review computation of weighted horizontal hydraulic conductivity
- ⑤ Wet bottom or dry bottom

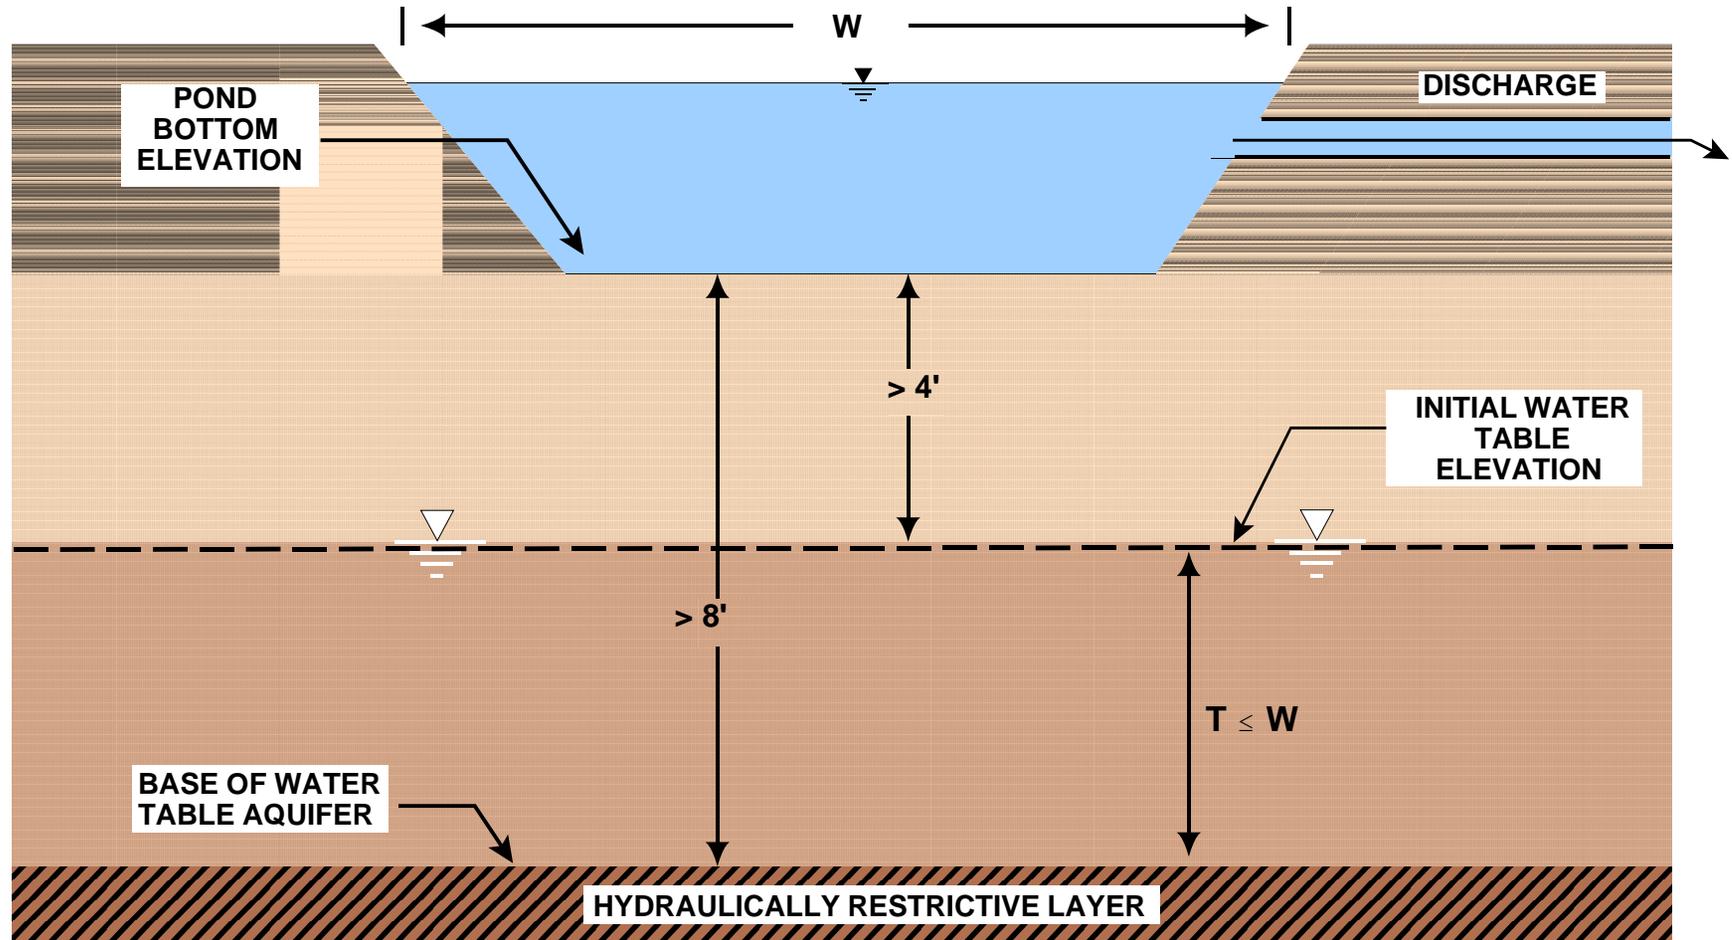

## Model #2 - Dry Retention With Thick Aquifer & Shallow Water Table

### Notes:

- ① Saturated thickness restricted to width of pond or trench. Important to remember this when modeling exfiltration trenches, narrow ponds or swales, or areas where there are deep saturated sand deposits such as the Lake Wales Ridge in Lake County and west Orange County, the Deland Ridge in Volusia County, and some of the deep sand and shell along some parts of the Atlantic Coastal Ridge in Volusia and Brevard County.
- ② Do not use unsaturated infiltration if SHWT within 1.5 ft of pond bottom

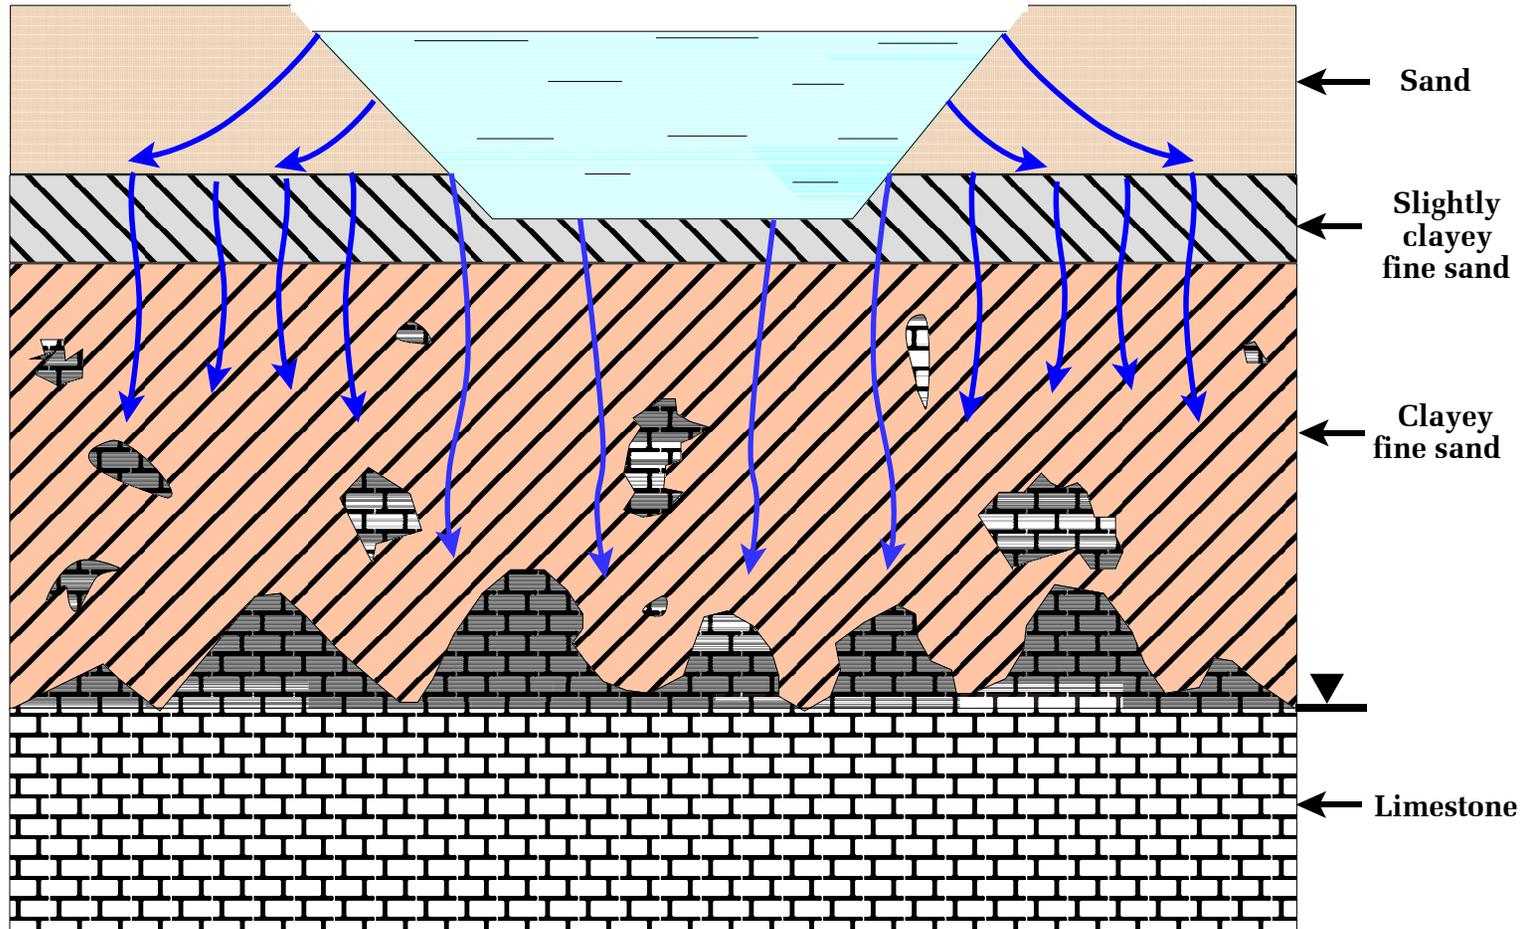

### Model #3 - Dry Retention With Thick Aquifer & Deep Water Table

**Notes:**

- ① Saturated thickness restricted to width of pond or trench.
- ② Do not use unsaturated infiltration if SHWT within 1.5 ft of pond bottom
- ③ Peak stage usually occurs during unsaturated perched flow. Competing software such as MODRET do not have this capability.

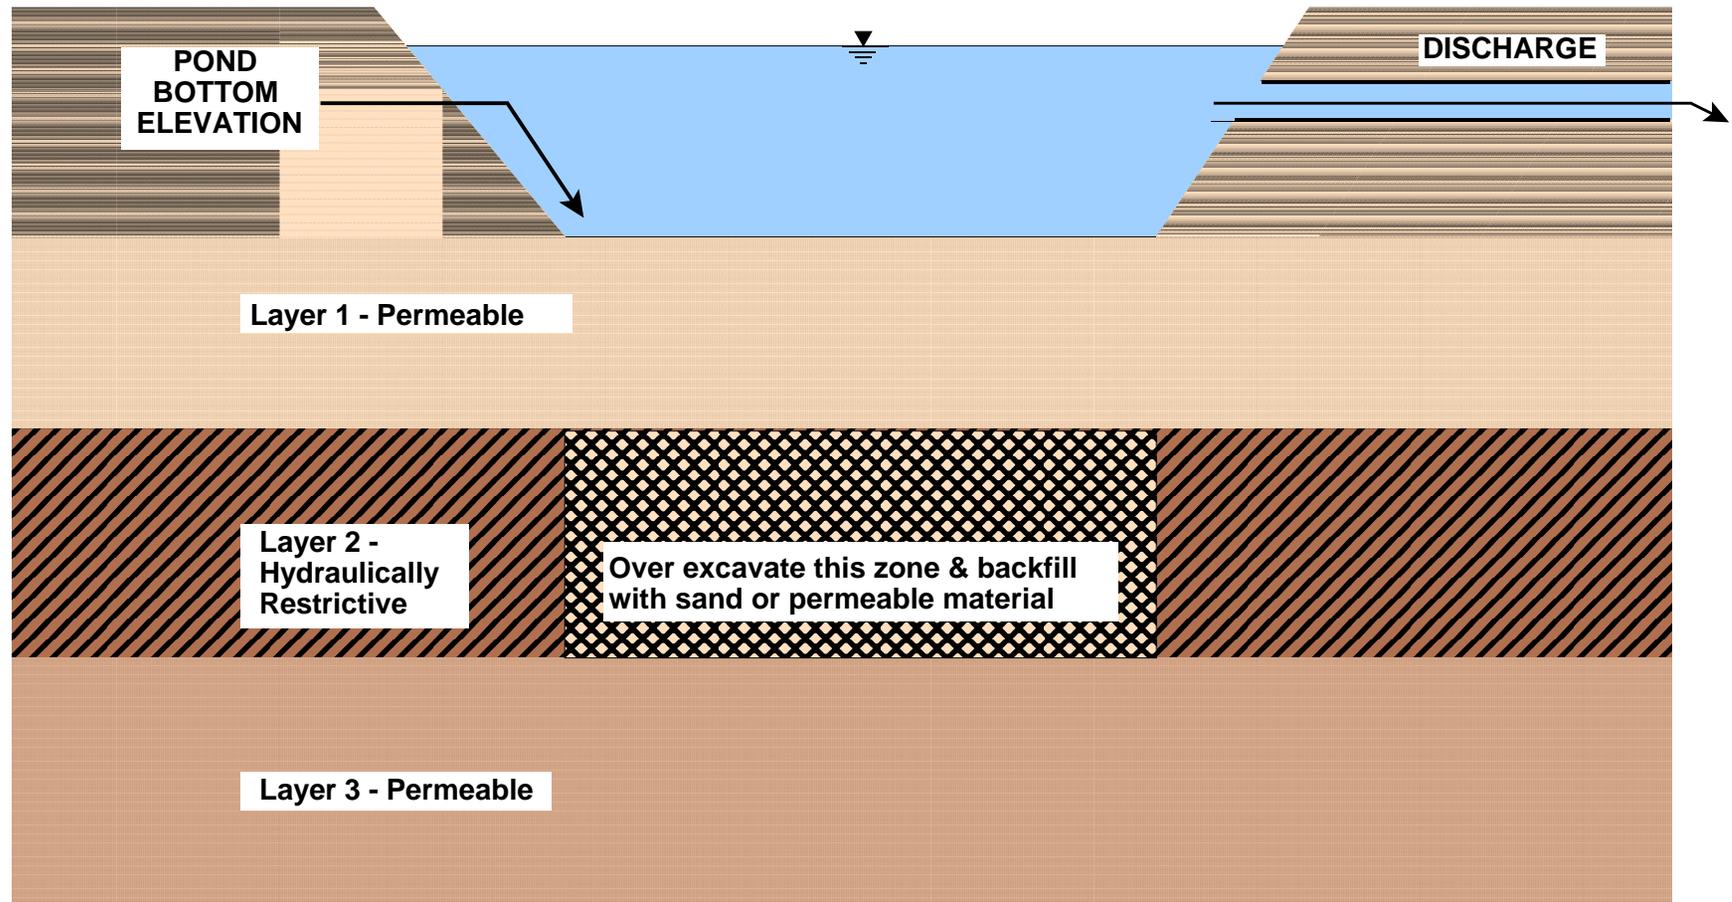

## Model #4 - Dry Retention In Leaky Aquifer With Deep Water Table

### Notes:

1. Typical of the Marion County area
2. Peak stage usually occurs during unsaturated perched flow
3. Pond bottom excavated into first clayey sand layer. important not to remold & compact clayey sand layer
4. Loading rate is rapid, water does not have much time to spread out in the upper sand for design storm event modeling

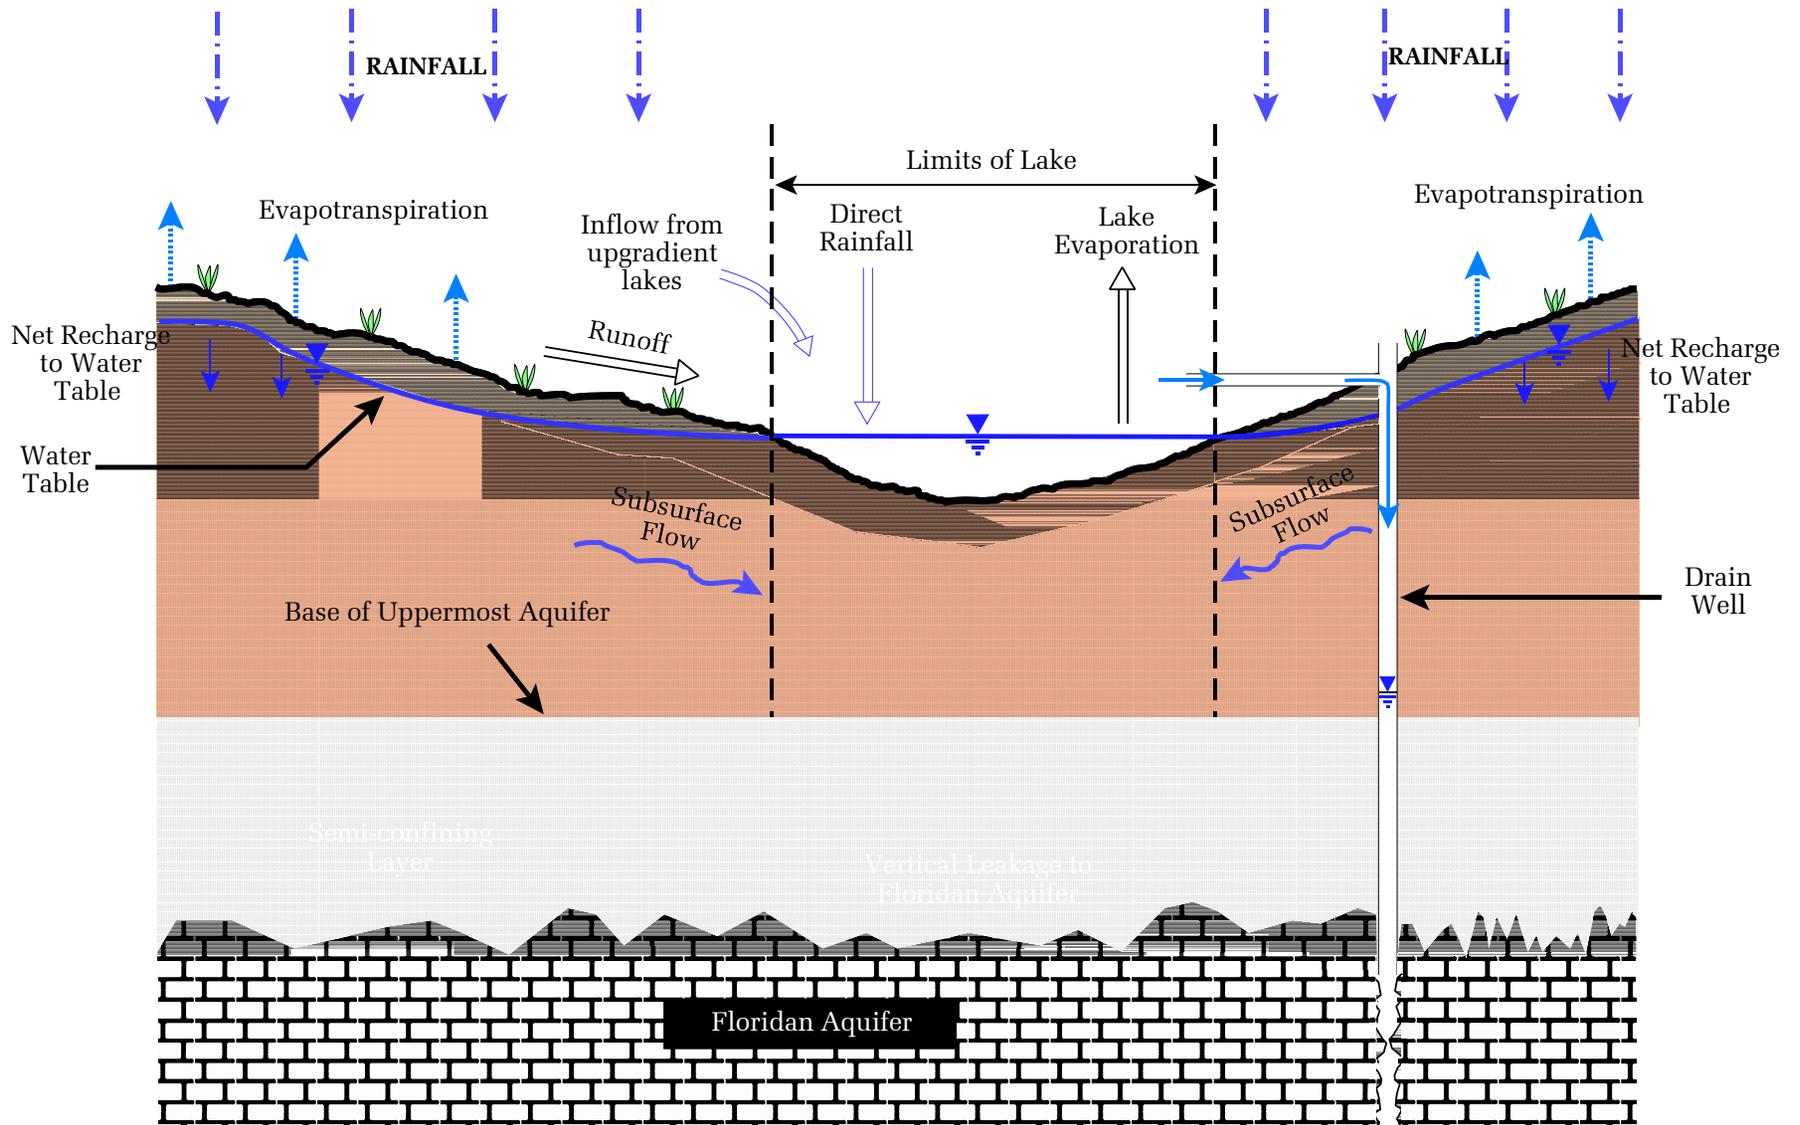

## Model #5 - Over excavate confining layer to access underlying secondary layer

### Notes:

- ① Typical in Brevard and Indian River County where the hardpan layer can be removed to access the lower zone of sand and shell
- ② Must be inspected by geotechnical engineer
- ③ Weighted horizontal hydraulic conductivity

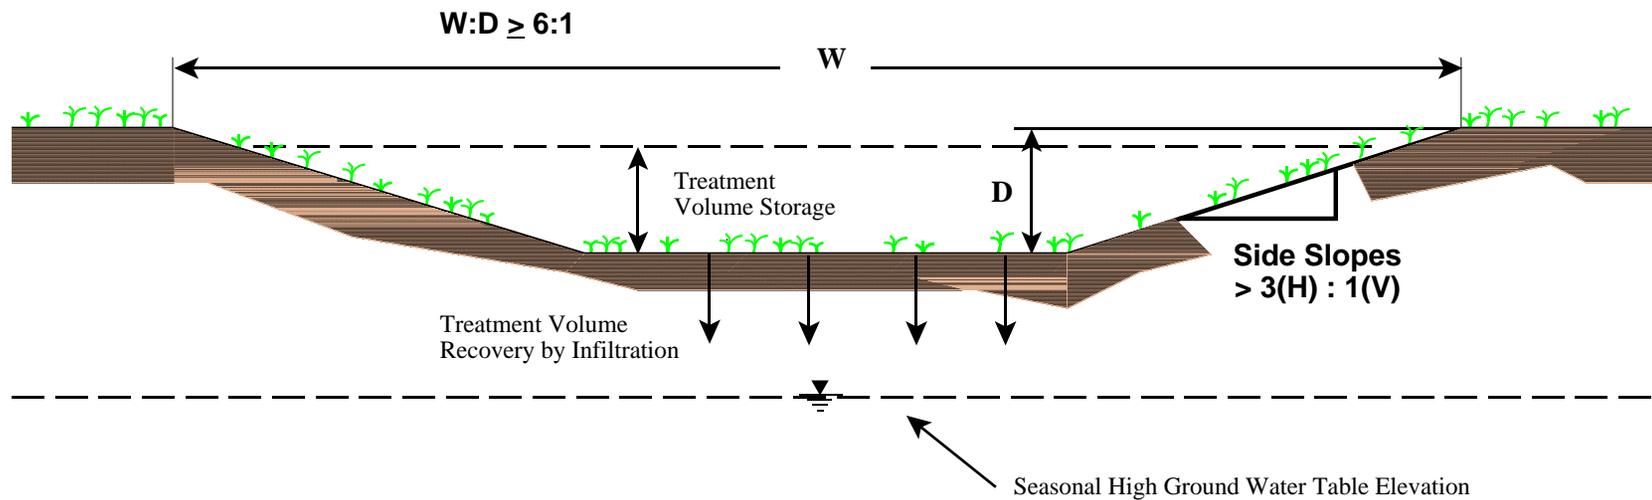

## Model#6 - Closed Basin With Low or High Vertical Leakage to Floridan Aquifer

### Notes:

- ① Difference between pot surface and water (or water table elevation) is more than 5 to 10 ft
- ② These are more susceptible to flooding and may require continuous simulation analysis

## Model # 7 - Swales

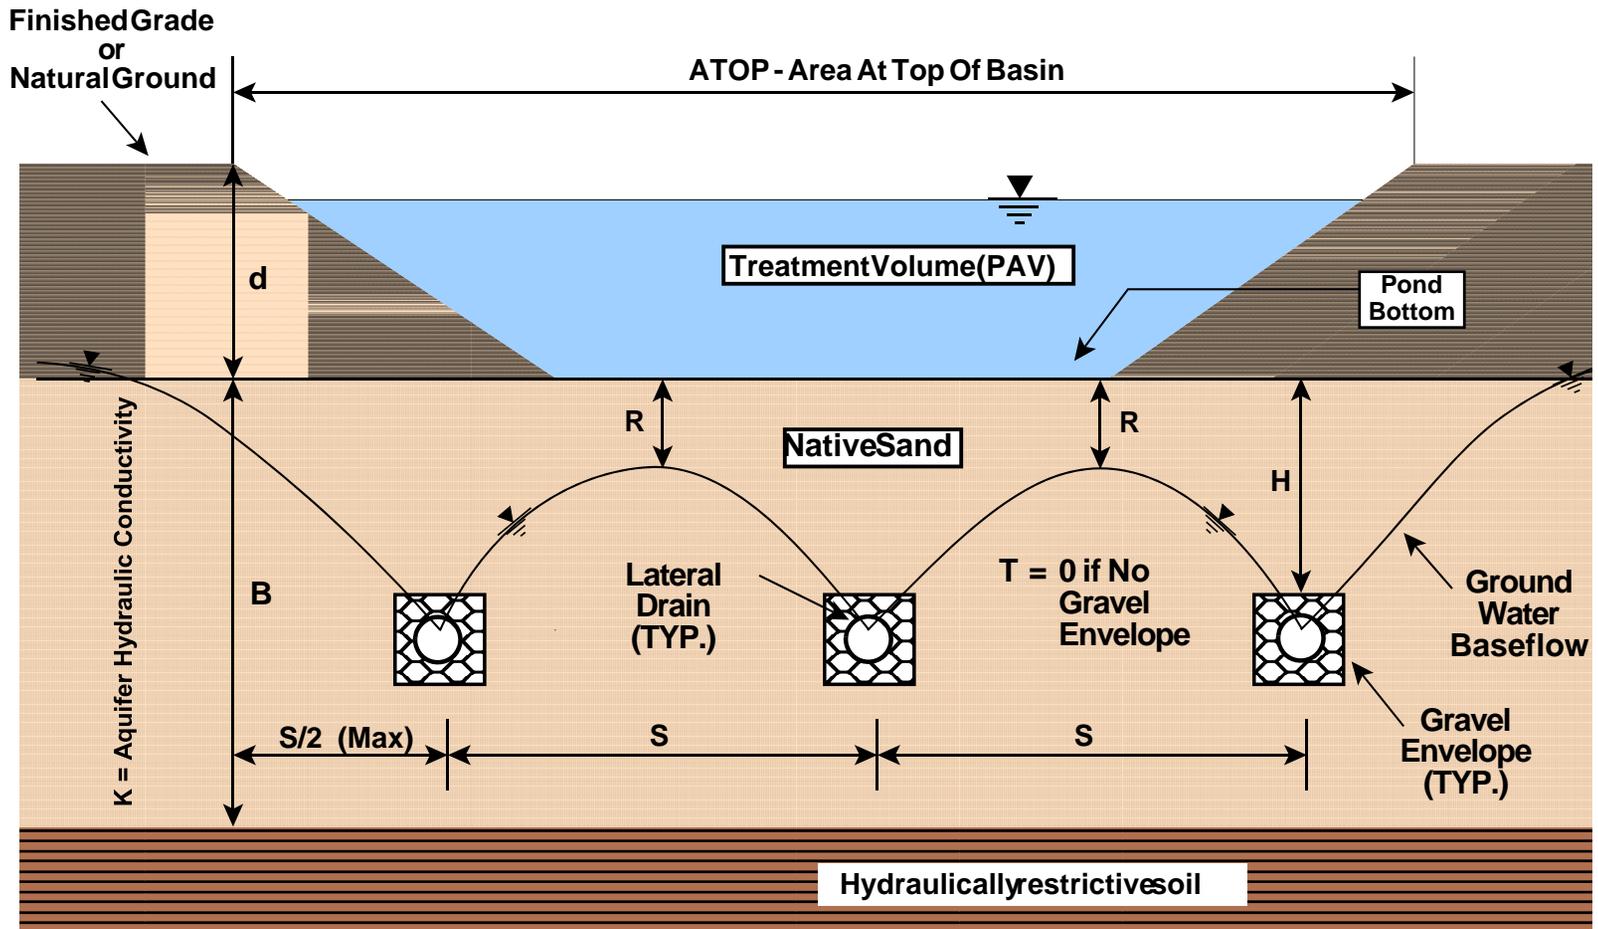

### Notes:

- ① Unlike a pond, there is open channel flow while the water is infiltrating
- ② Recommend that this be applied only for unsaturated infiltration. Suitable for sites with HSG "A" soils with sand and deep water table.
- ③ Most engineers do not analyze this properly
- ④ 3yr/1 hr storm; analyze to see is 80% of volume can be percolated.

Swale.wb2

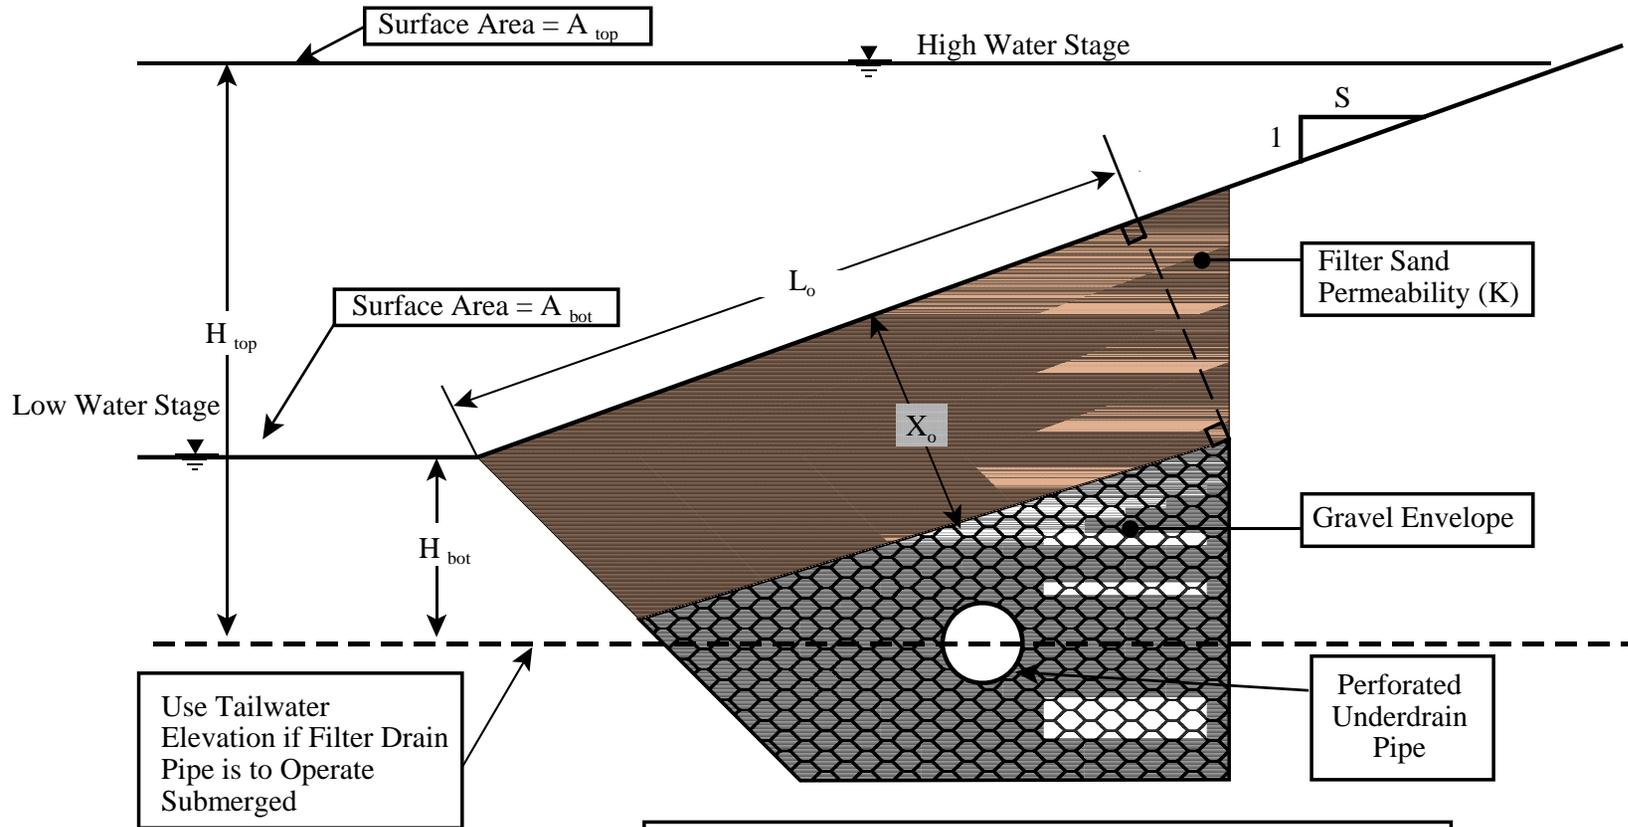

## Model#8 - Dry Retention Using Underdrain System

### Notes:

1. This system is popular since the retention volume requirements are the same as dry retention ponds
2. Main limitation is finding gravity outfall for the underdrain pipes
3. Baseflow must be included
4. Sometimes hydraulically restrictive soil can be overexcavated from base of pond and replaced with free draining fine sand from on-site source

## Model # 9 - Side-bankfiltrationsystem

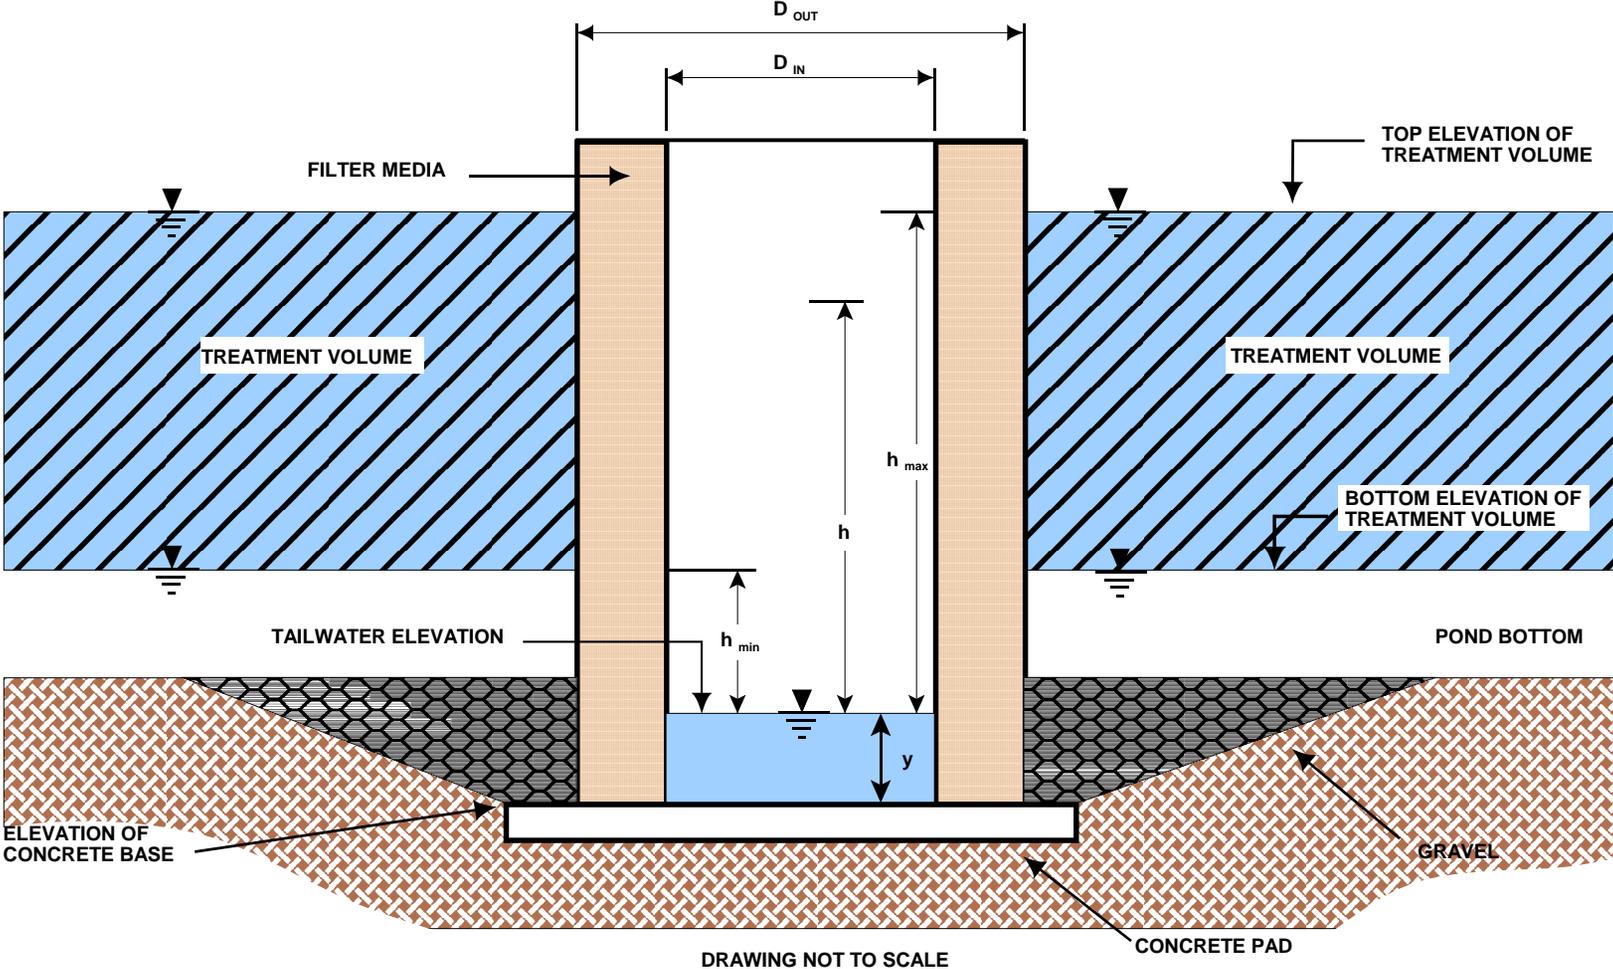

Notes:  
 ①  $P = \text{Treatment Volume} / \text{Volume between } A_{top} \text{ and } A_{bot} \times 100\%$   
 Note: For efficient and economical design, Use  $P \leq 95\%$

### Notes:

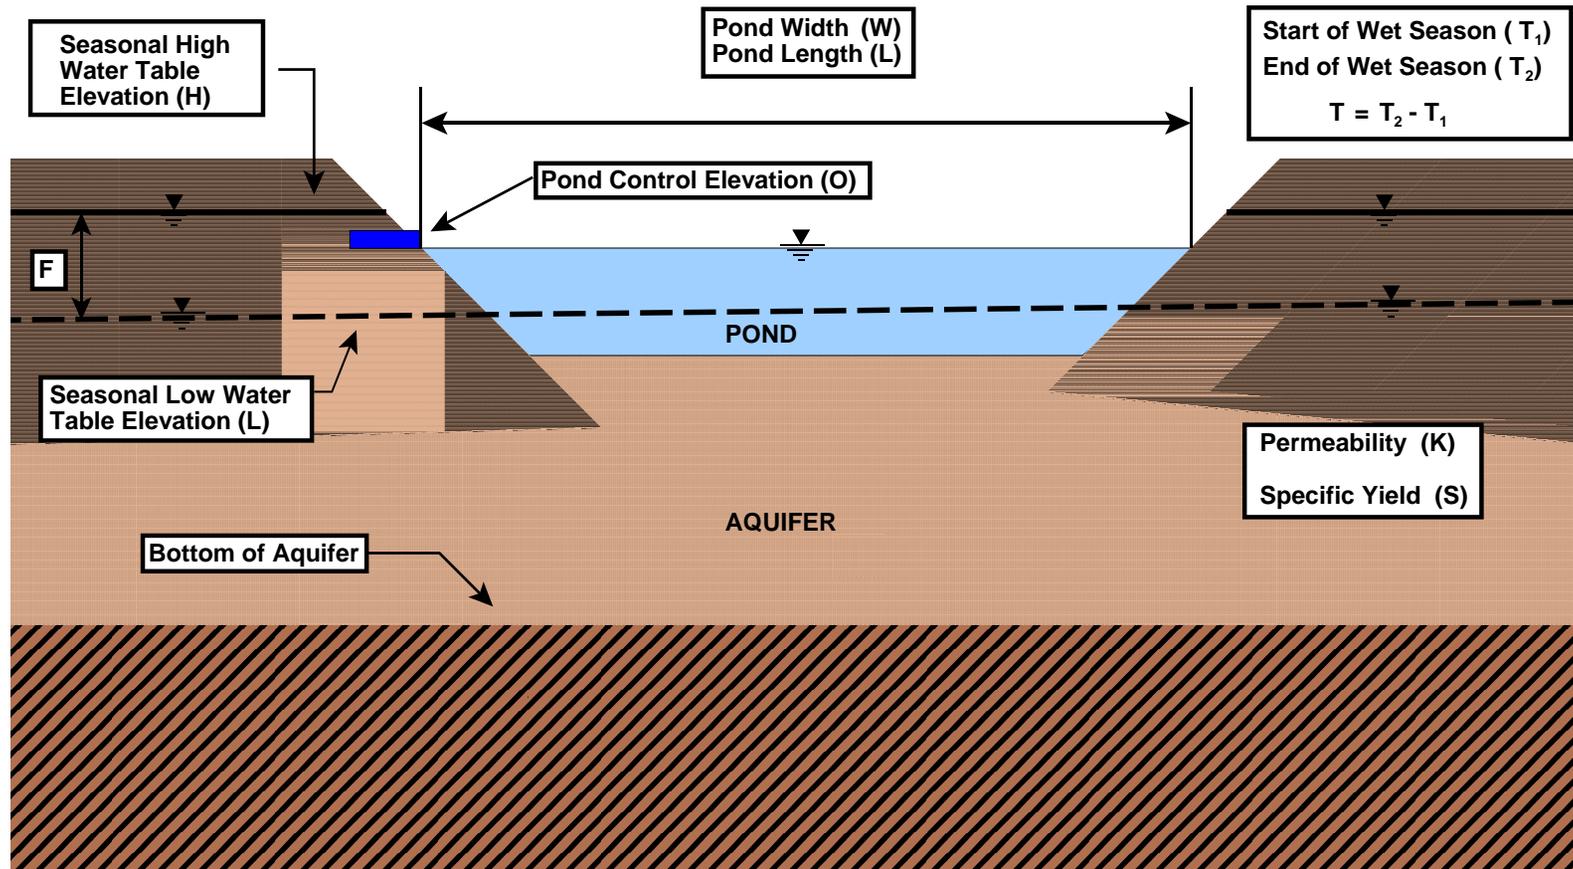

- ① Nowanindividualpermit
- ② Subjecttocloggingespeciallynexttowetlandtypesolis
- ③ Includegroundwaterbaseflow

# Model # 10 - Vertical Volume Recovery Structures

- Notes:**
- ① Nowanindividualpermit
  - ② Subjecttocloggingespeciallynexttowetlandtypesoils
  - ③ Includegroundwaterbaseflow

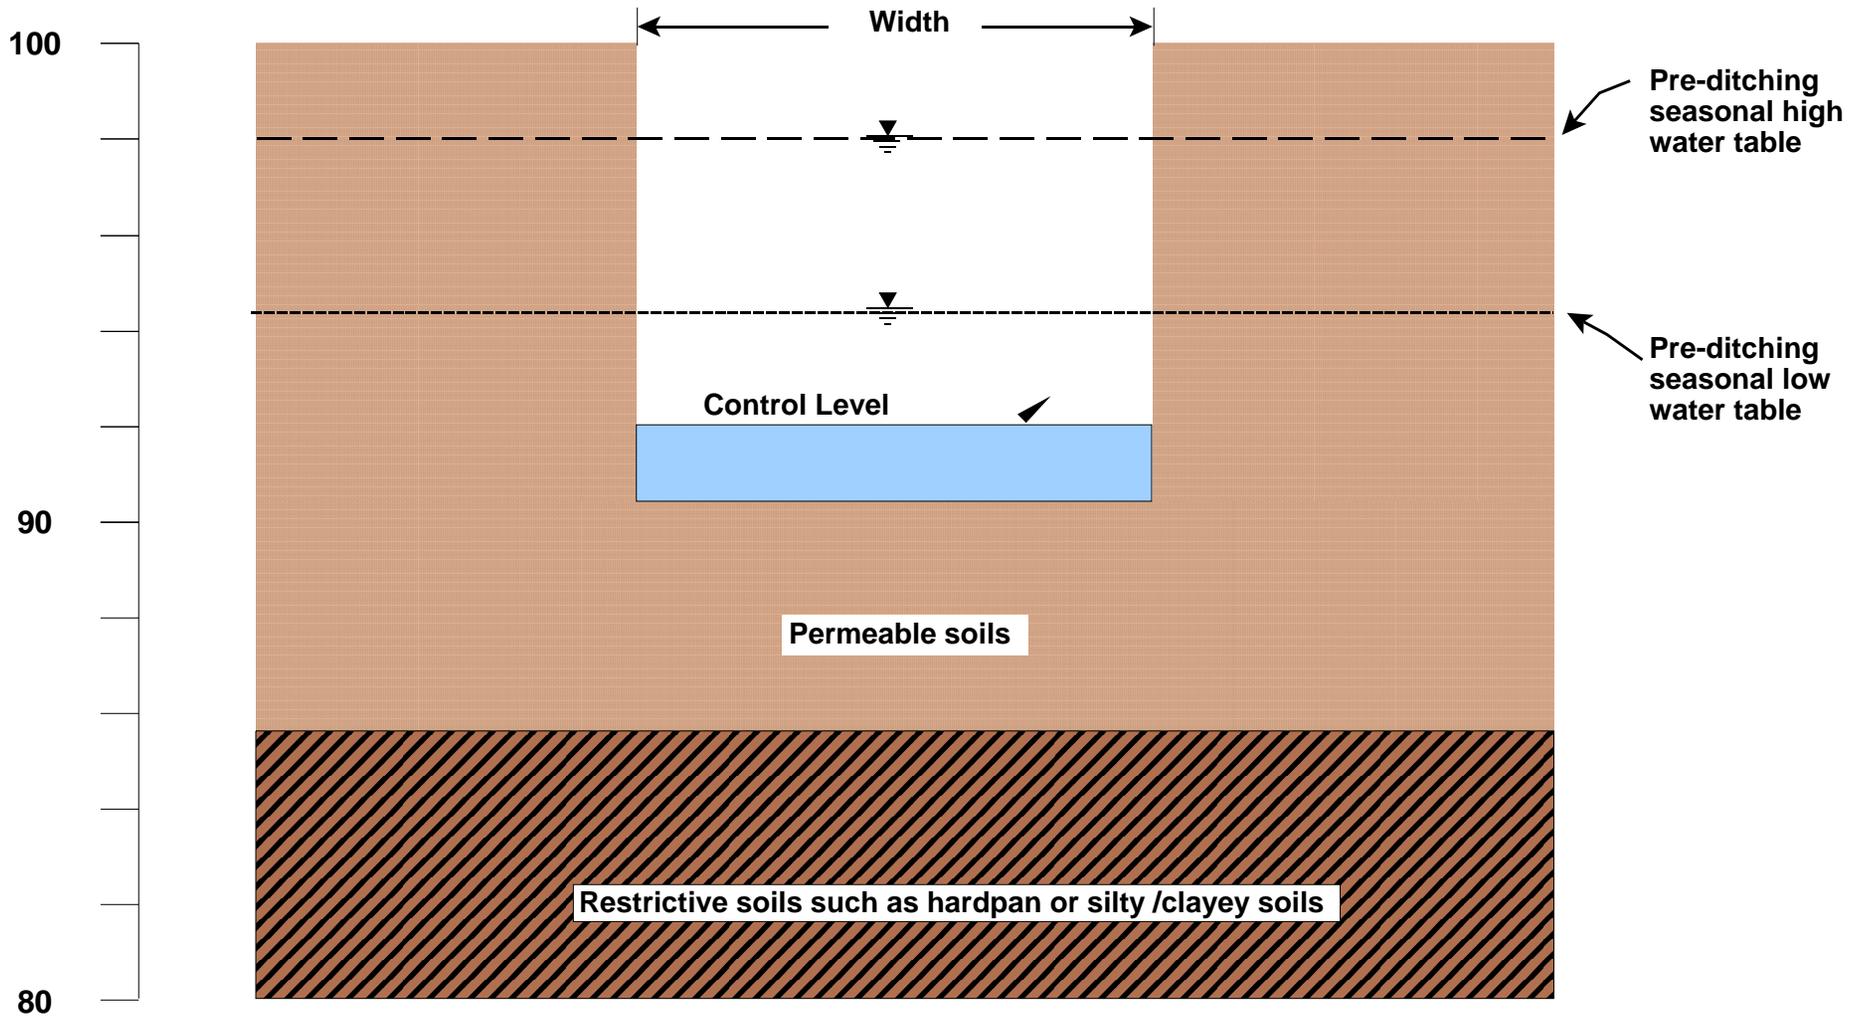

## Model#11 - Ground Water Baseflow or Wet Detention

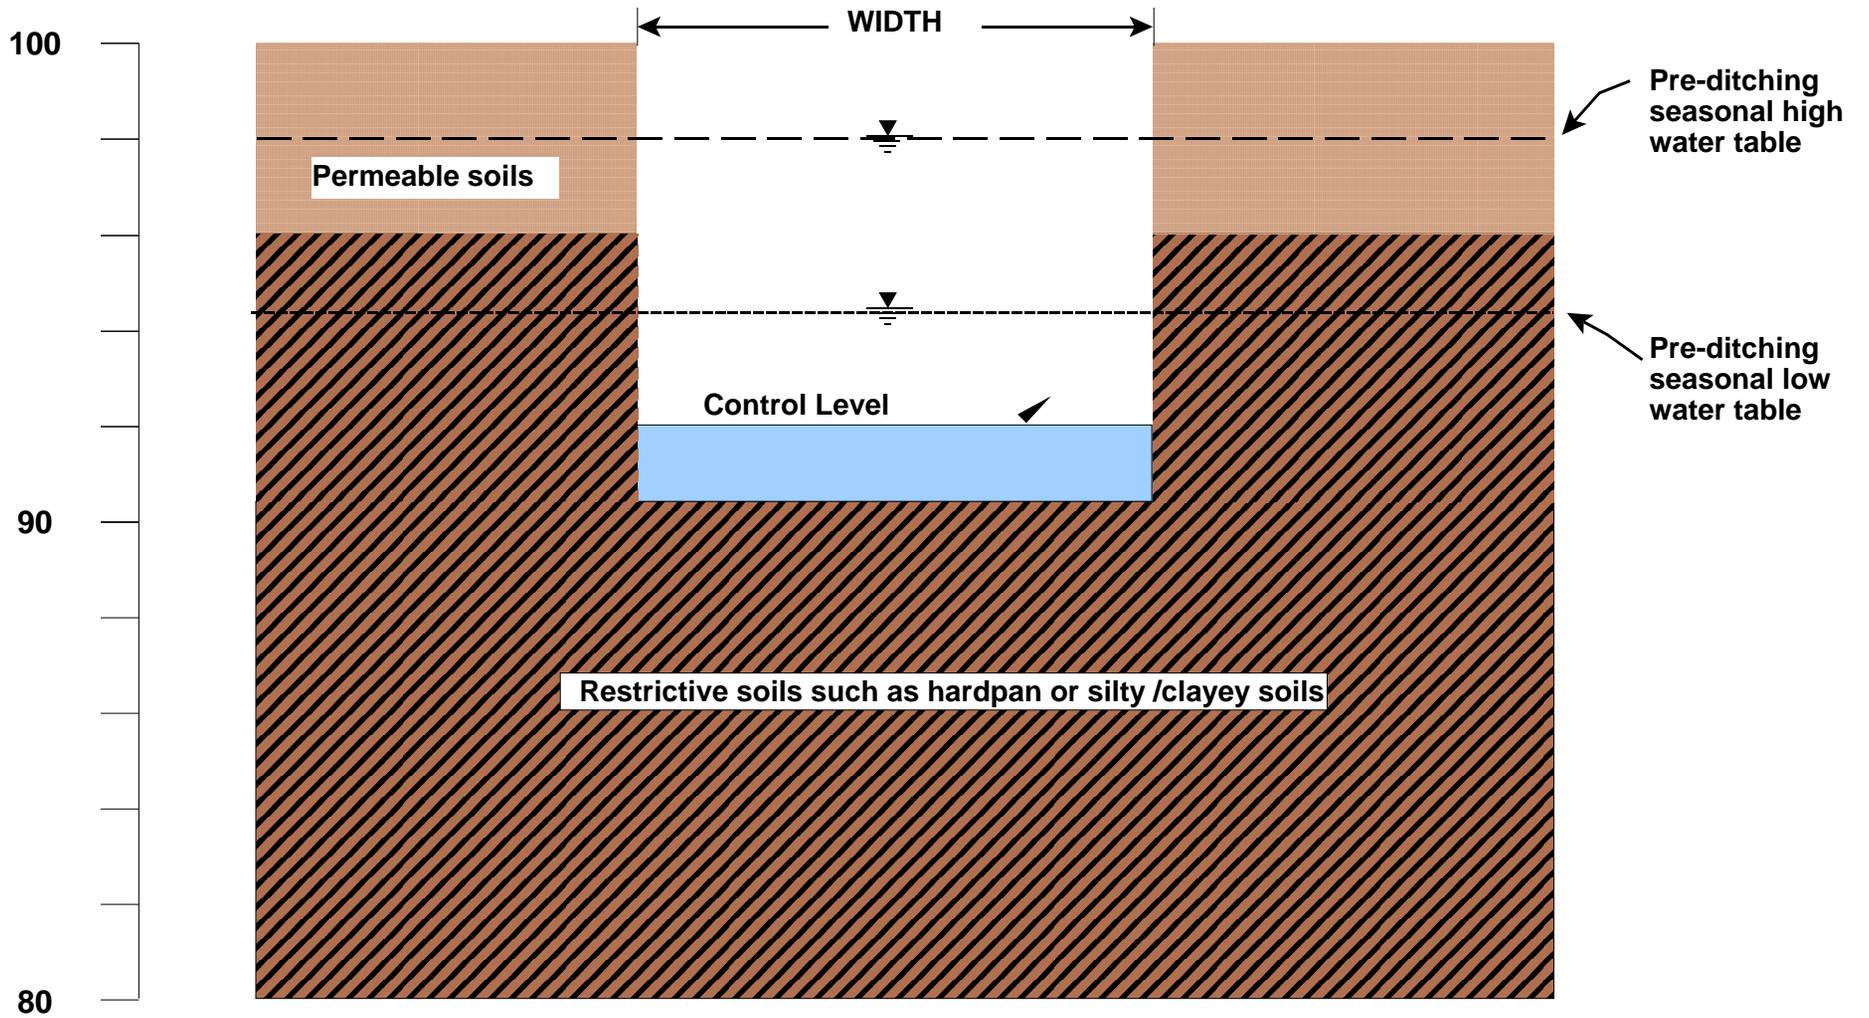

### Notes:

- ① 40C-42 allows us to set the control level at the average wet season water table elevation
- ② Important to include baseflow in residence time calculations
- ③ Weighted horizontal hydraulic conductivity

# SEEPAGE THROUGH FILL BERM

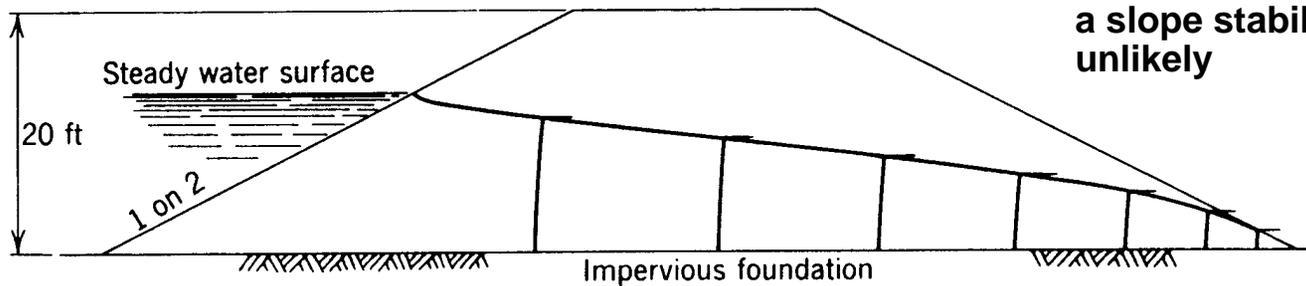

Note: most berms actually fail by overtopping and the resulting slope erosion instead of stability of the outboard slope.

## Transient flow situation

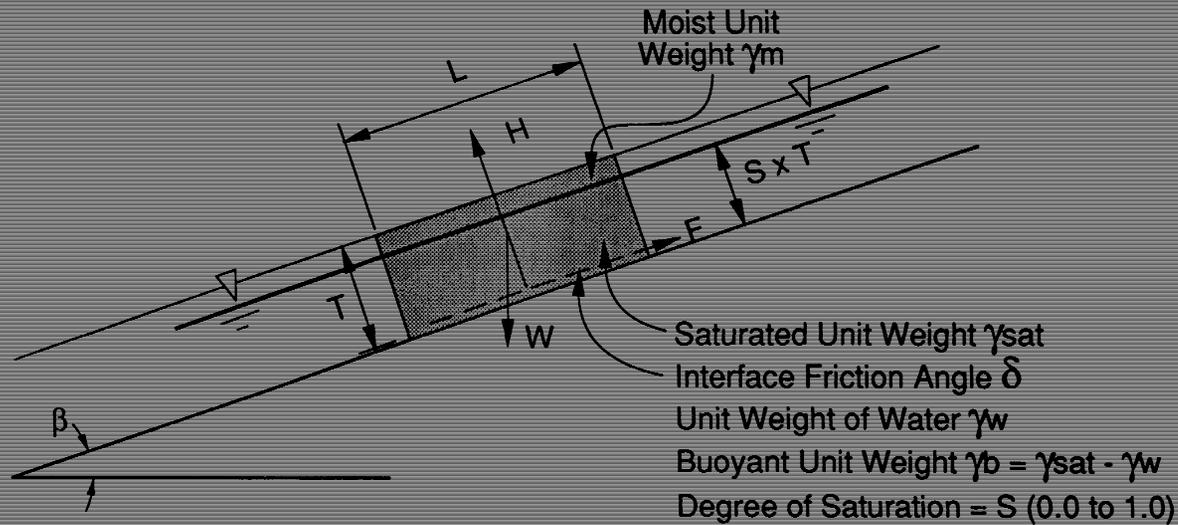

important when more than 3 ft of fill above natural grade

Note: if the pond recovers before the transient flow net exits the outboard slope, then a slope stability failure is unlikely

## Steady state flow situation

# Illustration of Theory for Slope Stability Analysis of Infinite Slopes (with & without seepage forces)

$\Sigma$  Forces parallel to slope

$$\text{Resisting Force: } F = \{ \gamma_m T (1-S) L + L \gamma_b T S \} \tan \delta \cos \beta$$

$$\text{Seepage Force: } = \gamma_w T S L \sin \beta$$

$$\text{Weight: } = \{ \gamma_m T (1-S) L + L \gamma_b T S \} \sin \beta$$

$$\text{Factor of Safety} = \frac{\text{Resisting Force}}{\text{Seepage Force} + \text{Weight}} = \frac{\tan \delta}{\tan \beta} \left\{ \frac{\gamma_m (1-S) + \gamma_b S}{\gamma_w S + \gamma_m (1-S) + \gamma_b S} \right\}$$

TABLE 1. Factor of Safety versus Depth of Failure Surface for Infinite Slopes

Factor: Moist Unit Weight, Saturated Unit Weight

Moisture Content of Soil Material: 10%, 20%, 30%

Failure Surface: Vertical, Horizontal, Circular

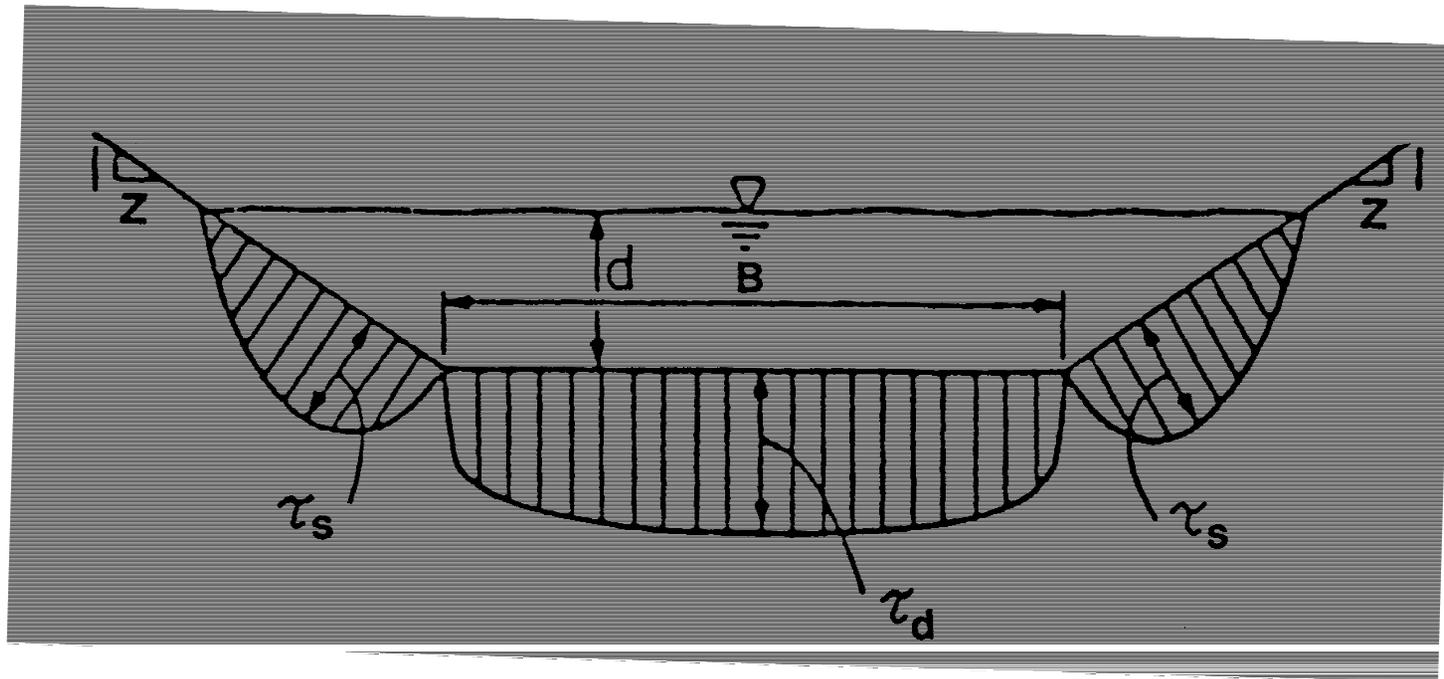

Unit Weight of Water: 9.81 kN/m<sup>3</sup>

Unit Weight of Soil Material: 18.0 kN/m<sup>3</sup>

Unit Weight of Saturated Soil Material: 20.0 kN/m<sup>3</sup>

Depth of Failure Surface (m)	Factor of Safety (Vertical)	Factor of Safety (Horizontal)	Factor of Safety (Circular)
0.5	1.00	1.00	1.00
1.0	1.00	1.00	1.00
1.5	1.00	1.00	1.00
2.0	1.00	1.00	1.00
2.5	1.00	1.00	1.00
3.0	1.00	1.00	1.00
3.5	1.00	1.00	1.00
4.0	1.00	1.00	1.00
4.5	1.00	1.00	1.00
5.0	1.00	1.00	1.00
5.5	1.00	1.00	1.00
6.0	1.00	1.00	1.00
6.5	1.00	1.00	1.00
7.0	1.00	1.00	1.00
7.5	1.00	1.00	1.00
8.0	1.00	1.00	1.00
8.5	1.00	1.00	1.00
9.0	1.00	1.00	1.00
9.5	1.00	1.00	1.00
10.0	1.00	1.00	1.00
